

What is claimed is:

Sub
A1

- 5 1. A branch predicting device, comprising:
a storing circuit storing information specifying
a return address of a subroutine when an instruction
equivalent to a subroutine call is detected;
- 10 a comparing circuit making a comparison between
information specifying a branch destination address
of an instruction which can possibly be an
instruction equivalent to a subroutine return and the
information specifying the return address stored in
said storing circuit, and outputting a result of the
comparison, when the instruction which can possibly
be the instruction equivalent to the subroutine
15 return is detected; and
an identifying circuit identifying an
instruction equivalent to a subroutine return, which
corresponds to the instruction equivalent to the
subroutine call, based on the result of the
20 comparison.
2. The branch predicting device according to
claim 1, wherein
said storing circuit stores a register number of
25 a link register, which is specified by the

002220" 240E3560

Cont
A1
instruction equivalent to the subroutine call, as the information specifying the return address.

3. The branch predicting device according to
5 claim 1, wherein

said storing circuit stores the return address of the subroutine as the information specifying the return address.

10 4. A branch predicting device, comprising:
a stack circuit storing information specifying a return address of a subroutine;

a push circuit pushing the information specifying the return address onto said stack
15 circuit, when an instruction equivalent to a subroutine call is detected;

a comparing circuit making a comparison between information specifying a branch destination address of an instruction which can possibly be an
20 instruction equivalent to a subroutine return and the information specifying the return address stored in a top entry of said stack circuit, and outputting a result of the comparison, when the instruction which can possibly be the instruction equivalent to the
25 subroutine return is detected; and

002220"240EES60

an identifying circuit identifying an instruction equivalent to a subroutine return, which corresponds to the instruction equivalent to the subroutine call, based on the result of the comparison.

5. The branch predicting device according to claim 4, wherein:

said push circuit pushes a register number of a link register, which is specified by the instruction equivalent to the subroutine call, onto said stack circuit as the information specifying the return address;

said comparing circuit makes a comparison between a register number of a branch destination address register, which is specified by the instruction which can possibly be the instruction equivalent to the subroutine return, and a register number stored in the top entry of said stack circuit; and

said identifying circuit identifies the instruction which can possibly be the instruction equivalent to the subroutine return as the instruction equivalent to the subroutine return when the compared register numbers match.

Cont
A1

6. The branch predicting device according to claim 5, wherein

said identifying circuit identifies the instruction which can possibly be the instruction equivalent to the subroutine return as the instruction equivalent to the subroutine return regardless of the result of the comparison, if the register number of the branch destination address register corresponds to a particular register.

7. The branch predicting device according to claim 5, wherein

said push circuit does not push the register number of the link register onto said stack circuit if the register number of the link register corresponds to a particular register.

8. The branch predicting device according to claim 4, further comprising

a pop circuit popping said stack circuit when said identifying circuit identifies the instruction which can possibly be the instruction equivalent to the subroutine return as the instruction equivalent to the subroutine return, and a branch by the instruction equivalent to the subroutine return is

taken.

9. The branch predicting device according to claim 1, further comprising

5 a predicting circuit storing branch history information for a branch prediction, wherein

002220" 240E560
said comparing circuit makes the comparison between the information specifying the branch destination address and the information specifying the return address, when the branch history information is registered to said predicting circuit.

10. The branch predicting device according to claim 1, further comprising

15 a circuit invalidating the information stored in said storing circuit when an event which causes a correspondence between a subroutine call and a subroutine return to be improper.

20 11. The branch predicting device according to claim 1, further comprising:

a predicting circuit storing branch history information for a branch prediction; and

25 a setting circuit setting in said predicting circuit a flag indicating that a return destination

Cont
A1

of a detected instruction equivalent to a subroutine return differs, when an instruction equivalent to a subroutine return, which does not return to an instruction address immediately succeeding the instruction equivalent to the subroutine call, is detected.

12. The branch predicting device according to claim 11, wherein

10 said predicting circuit comprises a return address stack circuit storing the return address of the subroutine, pops said return address stack circuit if the flag is recognized at the time of a branch prediction, and does not use a popped return address as a predicted branch destination.

13. The branch predicting device according to claim 1, further comprising:

20 a predicting circuit storing branch history information for a branch prediction; and

a circuit performing a control such that a predetermined flag is set when an instruction equivalent to a subroutine call, which is unregistered to said predicting circuit, is detected, the predetermined flag is reset when an instruction

Cont
A1

equivalent to a subroutine return, which corresponds to the unregistered instruction equivalent to the subroutine call, is detected, and the instruction equivalent to the subroutine return corresponding to the unregistered instruction is not identified as an instruction equivalent to a subroutine return in said predicting circuit.

14. A branch predicting device, comprising:

a return address stack circuit storing a return address of a subroutine when an instruction equivalent to a subroutine call is detected;

a comparing circuit making a comparison between a branch destination address of an instruction which can possibly be an instruction equivalent to a subroutine return, and the return address stored in said return address stack circuit, and outputting a result of the comparison, when the instruction which can possibly be the instruction equivalent to the subroutine return is detected; and

an identifying circuit identifying an instruction equivalent to a subroutine return, which corresponds to the instruction equivalent to the subroutine call, based on the result of the comparison.

002220"240EE550

Cont
A1

15. A branch predicting method, comprising:

registering information specifying a return address of a subroutine when an instruction equivalent to a subroutine call is detected;

5 making a comparison between information specifying a branch destination address of an instruction which can possibly be an instruction equivalent to a subroutine return and the registered information specifying the return address, when the
10 instruction which can possibly be the instruction equivalent to the subroutine return is detected;

identifying the instruction which can possibly be the instruction equivalent to the subroutine return as an instruction equivalent to a subroutine
15 return, which corresponds to the instruction equivalent to the subroutine call, if the information specifying the branch destination address and the information specifying the return address match;

identifying the instruction which can possibly
20 be the instruction equivalent to the subroutine return not as the instruction equivalent to the subroutine return, which corresponds to the instruction equivalent to the subroutine call, if the information specifying the branch destination address
25 and the information specifying the return address do

002220"2405550

Cont
A1

not match; and

making a branch prediction by using an identification result.

5 16. A branch predicting device, comprising:
storing means for storing information specifying
a return address of a subroutine when an instruction
equivalent to a subroutine call is detected;

10 comparing means for making a comparison between
information specifying a branch destination address
of an instruction which can possibly be an
instruction equivalent to a subroutine return and the
information specifying the return address stored in
said storing means, and for outputting a result of
15 the comparison, when the instruction which can
possibly be the instruction equivalent to the
subroutine return is detected; and

identifying means for identifying an instruction
equivalent to a subroutine return, which corresponds
20 to the instruction equivalent to the subroutine call,
based on the result of the comparison.

17. A branch predicting device, comprising:
stack means for storing information specifying
25 a return address of a subroutine;

002220-24022560

Cont
A1

push means for pushing the information specifying the return address onto said stack means, when an instruction equivalent to a subroutine call is detected;

5 comparing means for making a comparison between information specifying a branch destination address of an instruction which can possibly be an instruction equivalent to a subroutine return and the information specifying the return address stored in
10 a top entry of said stack means, and for outputting a result of the comparison, when the instruction which can possibly be the instruction equivalent to the subroutine return is detected; and

15 identifying means for identifying an instruction equivalent to a subroutine return, which corresponds to the instruction equivalent to the subroutine call, based on the result of the comparison.

18. A branch predicting device, comprising:
20 return address stack means for storing a return address of a subroutine when an instruction equivalent to a subroutine call is detected;

 comparing means for making a comparison between a branch destination address of an instruction which
25 can possibly be an instruction equivalent to a

002220" 240EES60

Cont
A1

subroutine return, and the return address stored in said return address stack means, and for outputting a result of the comparison, when the instruction which can possibly be the instruction equivalent to the subroutine return is detected; and

identifying means for identifying an instruction equivalent to a subroutine return, which corresponds to the instruction equivalent to the subroutine call, based on the result of the comparison.
